# Top 6 Cyber Incident Types

During the reporting period, our IR team identified these top six types of cyber incidents – with **3 collectively** accounted for **92%** of all IR cases

\*New category for IR data

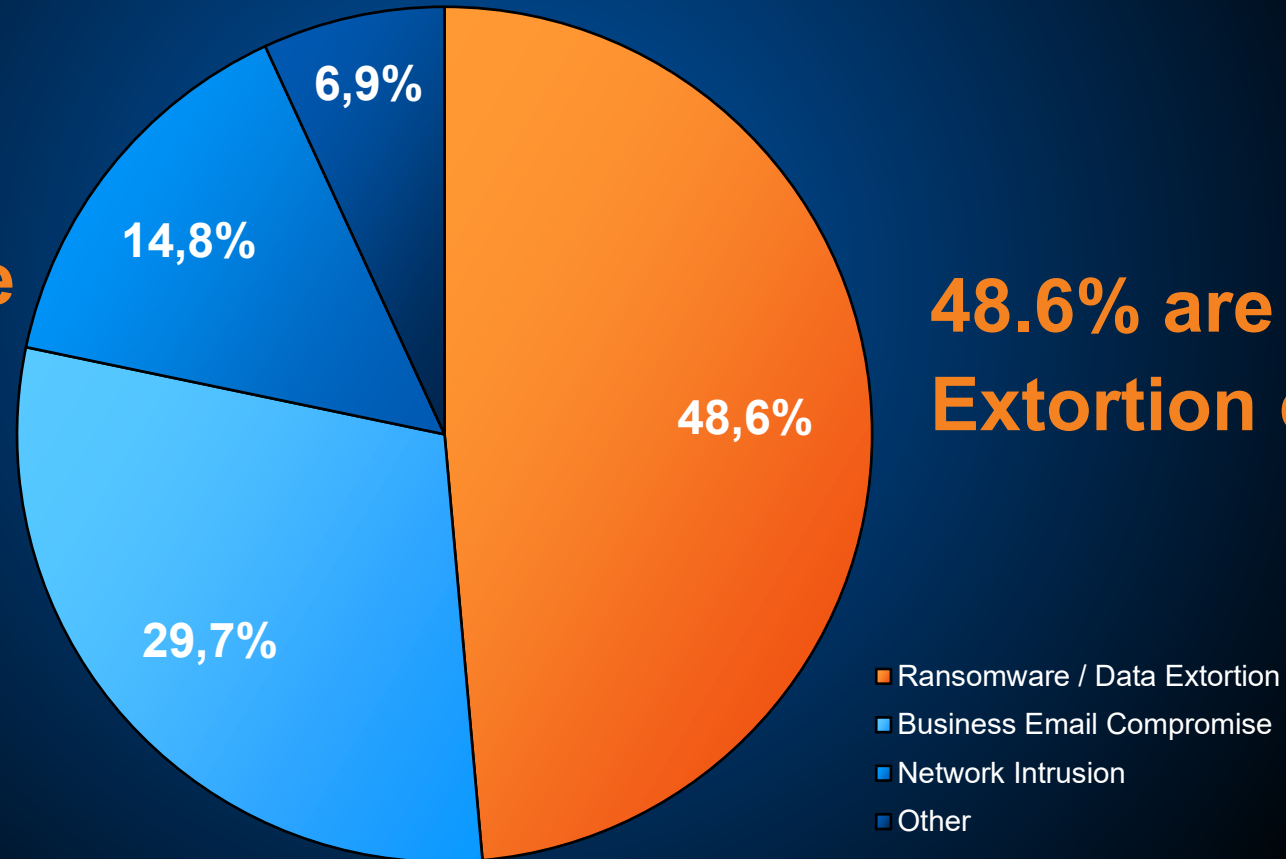

# Incident Response Investigations

What did we see?

Incident Response Investigations by Type

**51.4% of cases are not ransomware attacks**

**48.6% are Double Extortion cases**

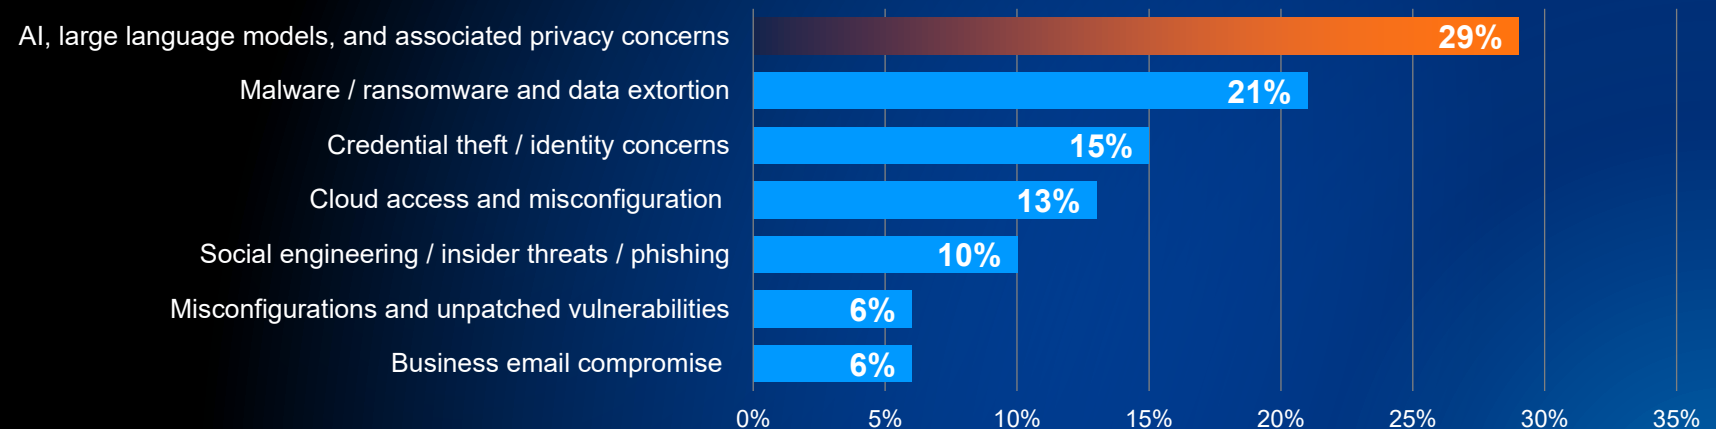

# This year's biggest concern, is a concern

All prior reports saw "Ransomware and data Extortion" take the #1 spot as most concerning

AI climbed to the top of the concerns, relegating ransomware to second place

What is your primary area of concern when it comes to cybersecurity in general? (select one)

But does the data backup this concern, or is marketing hype and fear of the unknown distracting us from the known?

# Why is AI so great for attackers but such a challenge for security teams?

## AI In the hands of the Attackers

- Hackers are increasingly using generative AI solutions, with 77% now reporting the adoption of such tools (Dark Reading)
- Automated phishing, deepfakes, and social engineering at scale
- Vulnerability exploitation at machine speed
- Attacks that adapt in real time to bypass defenses
- Every successful attack fuels the next

## AI In the hands of the Defenders

- Hallucinations and mistakes erode trust
- Brittle reasoning collapses under real-world pressure
- Pilots that never make it to production
- "Best guess" answers in a domain where guessing is fatal
- Difficult to deploy, adding costs without ROI

## Anthropics nye AI-model sætter myndigheder i alarmberedskab: Britiske finansbosser indkaldes til sikkerhedsbriefing

De britiske finansmyndigheder har fået travlt med vurdere en række potentielle sikkerhedshuller, som Anthropics nye AI-model har opdaget. I løbet af de kommende uge vil landets finanstop blive indkaldt til en briefing om modellen.

13. april 2026 kl. 08.10    ✉    🖨

Anthropic skrev i et blogindlæg i begyndelsen af april, at modellen har identificeret tusindvis af alvorlige sårbarheder i en lang række styresystemer, webbrowserne og anden meget udbredt software. Selskabet hævder, at nogle af sårbarhederne har eksisteret i softwaren i årtier uden at blive opdaget.
